

IN THE CLAIMS

Please amend the claims as follows:

1. (Currently Amended) An authentication system suitable for automatically providing authentication to a user at a client node, the user providing a user secret and requesting access to network resources resident at one or more server nodes in a distributed network system, said authentication system comprising:

a local application program interface for receiving the user secret, said local application program interface in communication with a requested network resource and the client node;

a cryptography service node including means for providing a common key and algorithm, and means for providing a client/server session key and algorithm; and

an authentication database in communication with said local application program interface and with said cryptography service node, said authentication database including

an authentication secret associated with the user;

means for encrypting said authentication secret using said common key and algorithm; and

means for encrypting said common key using said client/server session key and algorithm;

wherein the local application program interface sends an encrypted authentication secret, an encrypted common key, and the session key to the client node for use with the requested network resource.

2. (Original) The authentication system of claim 1 further comprising means for encrypting and decrypting said authentication secret using a secret store key and algorithm.

3. (Original) The authentication system of claim 1 further comprising, a network resource identifier associated with said requested network resource; and a network policy associated with the user and with said network resource identifier.

4. (Original) The authentication system of claim 1 wherein said authentication database further comprises,

a second network resource identifier associated with a second network resource;  
a second authentication secret associated with the user; and  
a second network policy associated with the user and with said second network resource identifier.

5. (Original) The authentication system of claim 4 wherein said authentication database further comprises means for encrypting and decrypting said second authentication secret using said secret store key and algorithm.

6. (Original) The authentication system of claim 4 wherein said authentication database further comprises means for encrypting and decrypting said second authentication secret using a second secret store key and algorithm.

7. (Original) The authentication system of claim 1 wherein said cryptography service further comprises means for generating an authentication secret from the user secret.

8. (Original) The authentication system of claim 1 wherein said common key comprises a symmetric key.

9. (Currently Amended) A method for automatically authenticating a user at a network client node in a distributed network system in response to a user request for access to network resources resident in one or more server nodes, said authentication method comprising the steps of:

providing a network resource identifier, a network resource policy, and an authentication secret to an authentication database, said network resource identifier associated with the requested network resource;

retrieving said authentication secret in response to said user request, said authentication secret associated with the user and with said network resource identifier;

encrypting said authentication secret with a common key and algorithm;  
encrypting said common key and algorithm with a client/server session key and  
algorithm; and  
~~providing sending~~ said encrypted authentication secret and said encrypted common key  
to the client node.

10. (Original) The method of claim 9 further comprising the steps of:

decrypting said encrypted common key using said client/server session key;  
decrypting said encrypted authentication secret using said decrypted common key and  
algorithm; and  
providing said decrypted authentication secret to the requested network resource.

11. (Original) The method of claim 9 further comprising the step of accessing said network  
resource policy prior to said step of retrieving said authentication secret, said network resource  
policy associated with the user and with said network resource identifier.

12. (Original) The method of claim 9 further comprising the steps of:

obtaining a list of client algorithms supported by the client node;  
obtaining a list of server algorithms supported by the server node;  
comparing said list of client algorithms with said list of server algorithms so as to  
determine the strongest algorithm common to both said list of client algorithms  
and said list of server algorithms; and  
using said strongest algorithm as said common key and algorithm.

13. (Original) The method of claim 9 wherein said common key comprises a symmetric key.

14. (Original) The method of claim 9 further comprising the steps of:

negotiating the strongest common algorithm between server and client node; and  
using said strongest algorithm as said client/server session key and algorithm.

15. (New) A method for authenticating a client to a network resource, comprising:  
receiving a client request for a network resource;  
authenticating the client and creating a secure session;  
creating an authentication secret for access to the network resource;  
encrypting the authentication secret within a common key;  
encrypting the common key with a session key associated with the secure session;
- and
- transmitting to the client the encrypted common key, the encrypted authentication secret, and the session key for use in accessing the network resource.
16. (New) The method of claim 15 further comprising, determining a strongest encryption and decryption algorithm supported by the client when encrypting the authentication secret within the common key.
17. (New) The method of claim 15 further comprising receiving, by the network resource, a decrypted version of the authentication secret from the client and authenticating the client for access to the network resource based on the decrypted authentication secret.
18. (New) The method of claim 15 further comprising associating policies with the authentication secret, wherein the policies define access rights of the client to the network resource.
19. (New) The method of claim 15 negotiating with the client encryption and decryption algorithms for use in encrypting the authentication secret and the common key.
20. (New) The method of claim 15 associating the authentication secret with the client and the network resource and housing the association in a secret store for additional secure sessions established by the client.
